Two chiral centres (diastereoisomers) - Massey University

Isomerases catalyze changes within one molecule. They convert one isomer to another, meaning that the end product has the same molecular formula but a different physical structure.

Achieving our core mission, namely progress through knowledge, now requires two kinds of communication: one to our scientific peers, but another, more fraught yet critical, to the broader public.

Cell-in-shell structures, also known as artificial spores, have great potential in nanomedicine because of their enhanced viability during in vitro manipulation and storage.

Enzyme catalysis is the increase in the rate of a chemical reaction by the active site of a protein. The protein catalyst may be part of a multi-subunit complex, and/or may transiently or permanently associate with a Cofactor (e.g. adenosine triphosphate).

Much has been written over many decades about the structure and properties of starch. As technology develops, the capacity to understand in more depth the structure of starch granules and how this complex organisation controls functionality develops in parallel.
